

The Maritime Economy Under Three Simultaneous Chokepoint Crises

Global maritime threat assessment

Issued: 2 August 2026 · **Scope:** 66 maritime entities across six regions, plus a conflict-vocabulary sweep · **Window:** 1 January - 2 August 2026 · **Liveness verified:** 2 August 2026

The operating picture

This assessment is written against an unprecedented backdrop: **three of the world's maritime chokepoints are simultaneously degraded or closed**. Every finding below is read against that context, because the disruption is what creates the pretexts.

Chokepoint	Status	Consequence for operators
Strait of Hormuz	Effectively closed since 28 February 2026 , following the US and Israeli air campaign against Iran	Dark tankers holding offshore, AIS spoofing on transits, ship-to-ship transfers with falsified positions, an LNG carrier struck on 1 August. Roughly a fifth of seaborne oil normally moves through here
Red Sea / Suez	Transits still around 60% below pre-2023 levels	Cape of Good Hope routing remains the commercial default; diversions expected to persist into 2027. Adds roughly 10-14 days and materially more fuel per rotation
Black Sea	Ukrainian corridor at zero traffic for the first time since 2023	28 civilian vessels struck in Greater Odesa between 20 June and 20 July, 21 killed. Ukraine estimates roughly \$900m per month in lost export value

The cyber picture tracks the physical one. Maritime cyber incidents rose **103%** year on year and attacks on maritime operational technology **150%**. GNSS spoofing now runs at roughly **1,000 disruptions per day affecting 40,000+ vessels**, concentrated in exactly the two theatres above - the Black Sea and the Strait of Hormuz. Phishing remains the most common initial access vector in the sector, and the average incident cost exceeds **USD 550,000**.

Executive summary

Detection was performed on **rendered page content**, never on domain names. **370 domains were confirmed in scope and 279 are still serving** as at 2 August 2026. **360 of the 370 carry no brand token** - in the maritime sector the abuse is almost entirely built on *function words* (bunker, crewing, charter, demurrage, corridor, strait) rather than on company names, which places it structurally outside domain-permutation monitoring.

370

CONFIRMED IN SCOPE

HORMUZ DOMAINS IN APRIL ALONE

The single most important finding is a registration wave, not a phishing kit. The Strait of Hormuz closed on 28 February 2026. In March, six Hormuz-themed domains were registered. **In April, 89 were.** The wave has continued every month since. This is the infrastructure of an information vacuum being filled at speed - and it is the environment in which a genuine lure becomes indistinguishable from opportunism.

STRATEGIC Finding 1 - The Hormuz information vacuum

145 domains in this assessment are built on Hormuz vocabulary. Their registration timeline maps precisely onto the closure:

Month registered	Domains	Relative volume
2026-02	1	
2026-03	6	
2026-04	89	
2026-05	15	
2026-06	21	
2026-07	10	

The strait closed at the end of February. March produced a trickle. **April produced 89** - a fifteen-fold increase - and the rate has never returned to baseline. What was registered is as informative as how much:

What the domain is	Domains	Still live
Other maritime	63	42
Crisis tracker / status site	56	43
News / commentary	10	6
Crypto token / speculation	10	8
Satire / game	4	2
Commodity / brokerage offer	1	1
Compliance / intelligence vendor	1	0

Why this matters operationally

The largest category is **crisis trackers** - sites answering the single question every charterer, insurer and operations desk is asking: *is the strait open today?* Representative examples include is-hormuz-open.com, isthehormuzstraitopened.com, ishormuzopened.site, strait-status.com, straightofhormuztracker.com, hormuzwatch.online, gulfcorridorindex.com and hormuz-sentinel.com.

Most of these are not malicious. That is precisely the problem. They are a mix of genuine open-source monitoring, ad-monetised opportunism, speculative domain holding and - in at least ten cases - **cryptocurrency tokens minted on the crisis** (hormuzstraitcoin.com, straitofhormuzcoin.com, hormuz.meme, hormuzopen.vip trading as \$HORMUZOPEN). A commercial operator cannot tell them apart at a glance, and a single credential or malware lure placed inside this wave inherits the camouflage of eighty-eight neighbours.

One entry, hormuzb2b.com, presents as a commodity brokerage for oil and metals - a business proposition arriving on the back of a closure that has made physical delivery largely impossible. That is the shape counterparty fraud takes in a supply shock.

OPERATIONAL Finding 2 - Regional distribution

Conflict-linked findings by theatre, with persistence:

Theatre	Domains	Live now	Median days live
Hormuz	145	102	102
BlackSea	47	37	92
Sanctions	35	34	37
NavIntegrity	30	20	127
Disruption	9	9	37
RedSea	4	4	155

Black Sea

Findings here cluster around **grain and export trade** rather than vessel operations - terra-grain.com (Ukrainian barley, oats and wheat), favoritpraim.space (Black Sea grain and oilseed), and a paired freight construction in ewayss.com and ede1wayss.com, both serving "Edelweiss Service Ukraine - Global Freight Transportation". A near-identical domain pair serving one page is the classic signature of a counterparty-fraud front.

One finding sits outside commercial fraud entirely: ukraynakontrat.xyz serves a Turkish-language "*Ukrayna Taktik Kontrat & Personel Alım Portalı*" - a tactical contract and personnel recruitment portal. Combatant or contractor recruitment aimed at a Turkish-speaking audience is a materially different risk class and is flagged rather than counted as maritime fraud.

Red Sea and Suez

Notably quiet - four findings only. This is consistent with the physical picture: with Cape routing now the established default rather than an emerging disruption, the Red Sea no longer generates the urgent, unresolved questions that drive opportunistic registration. **Crisis-linked abuse tracks novelty, not severity.**

Navigation integrity

30 findings reference AIS, GNSS or GPS interference. The legitimate detection market is real and was excluded where identifiable. What remains is a supply of tooling and advisory around a capability that is being used operationally in both the Black Sea and the Gulf.

TACTICAL Finding 3 - The soft administrative layer

Separately from the conflict sweep, 100 findings target the maritime industry directly - and **90 of them carry no brand token**. The distribution is the point:

Category	Findings	Live now	No brand token
Seafarer crewing	32	24	32
Carrier impersonation	22	13	12
Bunker fuel supply	19	18	19
Chartering / broking	17	11	17
Port / terminal	7	6	7
Documentation / tracking	3	1	3

Seafarer crewing - the highest-volume category

32 findings, **every one carrying no brand token**, presenting as crewing and manning agencies: tritonrms.com, maritimematch.com, academymaritime.store, able-seaman-jobs.com and able-seaman-jobs.org as a pair, ycrewingmaritime.com, garantmarinegroup.com, seafarerjobbd.com.

Seafarer recruitment fraud works because the sector normalises upfront payment. Candidates routinely pay for certification, medicals, visa processing and agency fees, so a request for money is unremarkable. Crewing is also structurally fragmented - thousands of small, legitimate agencies operate in Manila, Chittagong, Odesa, Mumbai and Istanbul - which means a fraudulent agency looks exactly like the real market. No brand-based monitoring can help here, because there is no brand being impersonated.

Bunkering - a templated regional set

Four domains registered on **15 and 16 May 2026** share one template: uaebunkering.com, indiabunkering.com, europebunkering.com and chinabunkering.com, each titled "Bunker Fuel Supplier in [region] — [N] ports". Bunker fraud is a long-standing sector problem: fuel is high value, paid in advance, delivered by barge, and quality disputes are normal - so a fraudulent supplier can take payment and simply not appear.

Carrier impersonation

22 findings target the container lines directly. The clearest are msc-track.com ("MSC Cargo - Official Website"), miamiservicescargo.com ("MSC Cargo US" - **no token**, and reading as a Miami freight company), and cmacgm-group.org, which takes the .org of the genuine cmacgm-group.com. A separate Maersk assessment run alongside this one found a "Maersk Invest" cluster using consonant-skeleton domains (mksrsk, mrsksk) that no permutation list would generate.

Assessment

- **Persistence is extreme across the board.** 76% of conflict-linked findings and 73% of maritime-brand findings are still serving. Median time live is 99 and 78 days respectively, with a maximum of 206 days. Nothing in this space is being removed.
- **Detection is not the constraint.** 305 of 363 findings were observable within 24 hours of registration. The industry sees these on day one and acts on them on day ninety-nine.
- **97% carry no brand token, and in crewing and bunkering it is 100%.** Maritime fraud is built on function words, not company names. Domain-permutation monitoring has almost no purchase on this sector.
- **Crisis-linked registration follows novelty, not severity.** Hormuz - closed, unprecedented, unresolved - generated 145 domains. The Red Sea, objectively still severely degraded but now a settled operating condition, generated four. Expect the next registration wave to follow the next *new* disruption, not the worst one.
- **The trust vacuum is the transferable risk.** An operator cannot distinguish a genuine strait tracker from an ad farm, a memecoin or a lure. That ambiguity is the attack surface, and it will reappear at every future chokepoint event.
- **The administrative layer is softer than the operational one.** Ports, canals and terminals returned almost nothing. Crewing, bunkering, chartering and documentation returned the volume. Attack the paperwork, not the crane.

Recommendations

TACTICAL Now

1. **Publish a single authoritative status source** for chokepoint transit decisions and instruct chartering, operations and insurance desks to use only that. The 56 competing "is the strait open" sites exist because that authority is absent.
2. **Block or flag the crypto-token subset immediately** - ten domains monetising the closure carry no legitimate operational use.
3. **Verify bunker suppliers out of band** before payment, specifically the four templated regional sites identified here.
4. **Issue a crewing advisory** to manning agents and cadets: no legitimate agency requires payment for placement. This category is 100% no-token and cannot be filtered technically.

OPERATIONAL This quarter

1. **Add content-based detection for function-word vocabulary** - bunker, crewing, charter, demurrage, bill of lading, corridor, strait - alongside any existing brand monitoring. That is where the findings are.
2. **Treat surcharge, war-risk and force-majeure notices as a payment-fraud control point.** They are legitimate, frequent, unexpected and carry payment instructions - the ideal BEC pretext in a disrupted market.
3. **Instrument the registration signal.** A sudden burst of domains on a chokepoint or route name is an early indicator of both the disruption and the fraud that follows it.

STRATEGIC This year

1. **Assume the next chokepoint event produces the same wave.** The Hormuz pattern - trickle, then a fifteen-fold spike one month later - is a template. Pre-register the obvious status-site names for routes you depend on, or pre-agree an authoritative source with counterparties.
2. **Extend brand protection to the counterparty layer.** The exposure that matters to a shipowner is not its own brand being cloned; it is a fraudulent broker, bunker supplier or crewing agent inside its transaction chain.
3. **Align cyber and physical risk reporting.** GNSS spoofing, AIS manipulation and web-based counterparty fraud are all now concentrated in the same two theatres. They should be briefed together, not by separate functions.

Detection quality and method

Two independent sweeps were run and correlated: a **brand sweep** across 66 maritime entities (carriers, tankers, ports, canals, class societies, P&I, satcom, forwarders, crewing, bunkering, chartering and documentation), and a **conflict-vocabulary sweep** independent of any brand list, built from the language the current crises generate.

The maritime domain has unusually heavy collisions, and 407 domains were removed before counting.

"Container" returns Docker and Azure containers, container homes and modular buildings. **"Gulf"** returns the US Gulf Coast, Gulf War veterans and an A-10 squadron history. **"Frontline"** returns HappyFleet, a frontline-worker HR product, across ten domains. **"Santos"** is a Brazilian surname and place, returning warehousing unrelated to the port. **Sanctions and compliance** returns a large legitimate AML and screening software market, plus CodeCargo, a GitHub Actions governance tool. Ukrainian charities and ordinary Ukrainian businesses were excluded from the Black Sea theatre.

Findings that proved to be legitimate businesses - genuine crewing agencies, real bunker suppliers, established freight forwarders, commercial GNSS-interference detection vendors - are recorded as excluded rather than counted. Where a site is opportunistic but not malicious, such as an ad-monetised strait tracker, it is reported as what it is. The point of the Hormuz finding is the *wave* and the ambiguity it creates, not an assertion that all 145 domains are hostile.

Scope and sourcing

Detection used rendered page content from Webamon sandbox scans across the period 1 January to 2 August 2026, with liveness and registration pairing verified on 2 August 2026. Registration dates are taken from the newly-registered-domain feed that first surfaced each domain. The operating picture is drawn from open-source reporting on the Hormuz closure, Red Sea transit volumes, Black Sea corridor suspension and published maritime cyber-incident statistics. No non-public information was used and no systems belonging to any named organisation were accessed. Co-location on shared hosting or CDN infrastructure is not treated as attribution evidence anywhere in this report.

Webamon threat intelligence. Global maritime assessment, issued 2 August 2026 against an operating picture of three simultaneously degraded chokepoints. This is a fast-moving environment and the registration wave described here is ongoing; the picture will change. Full scan evidence - screenshot, DOM capture, hosting and request chain - is available for every domain listed. Suitable for onward distribution to operations, chartering, insurance and security functions.
