

INFRASTRUCTURE THREAT HUNT · OCTOBER 2026

Malicious Infrastructure on Bulletproof ASNs — Fingerprint Clusters

We selected scan documents hosted on **25 curated known-malicious / bulletproof ASNs** (AEZA, Stark Industries, Media Land, Prospero, IP Volume/Quasi, Chang Way, AlexHost, Pfcloud, Private Layer, The Infrastructure Group/LITESERVER, NovoServe and others), then clustered them on the Webamon **DOM content fingerprint** (`fingerprint.dom`) and ranked every cluster by **purity** — the share of a fingerprint's entire-corpus footprint that falls inside bad ASNs. A high-purity fingerprint is one that **surfaces only malicious infrastructure**. Purity cleanly separated real kit signatures from server-default pages (`403/404/nginx/FASTPANEL/empty`), which score 1–4% and were rejected. **Six high-purity clusters** survived; the headline is a live, 100%-pure **Avianca LifeMiles credential-phishing** operation on bulletproof AS60404.

Key judgements

CONFIDENCE-RATED

- HIGH

A live **Avianca LifeMiles** credential-phishing operation (fingerprint `4f1ef14b...`, **100% pure** — present on no other content in the corpus) runs 35 obfuscated domains, 25 still hosting. Rescans render the Spanish 'Iniciar sesión' login on **5.255.113.213 / AS60404 (The Infrastructure Group / LITESERVER)** — `id1lbonssliffmld.com` `1f1mlscolbonss.com` `rec1bonlifms.com` — and are multi-homed onto Namecheap 66.29.148.x for resilience. The fingerprint tracked the operation across that host rotation.
- HIGH

NovoServe (AS204601) is the most productive bulletproof host in-window, carrying three distinct high-purity operations: a 1win/1xbet affiliate fleet (now on a dedicated 81.91.178.0/24 block, some Yandex-fronted), a 39-domain 'Сократитель ссылок' **URL-shortener** redirector layer (`a2bc.shop`, fp `597d510b...`), and a numbered Russian **film-piracy** fleet.
- MOD

Pfcloud (AS51396) and **Private Layer (AS51852)** hold pre-positioned staging: keyboard-mash/numeric DGA husks (`571255.xyz`, fp `c277ea6c...`) and a 158-domain 1xbet-*.top parked namespace (fp `38a93f10...`, 96 already rotated offline) — infrastructure provisioned ahead of activation.
- MOD

AEZA (OFAC-sanctioned), Stark Industries, Media Land and Prospero are present in the corpus but carried **no high-purity clusterable kit** in this window — their footprint here is thin server-default husks, not live campaigns.

Fingerprint clusters

THE DELIVERABLE · RANKED BY PURITY

FINGERPRINT.DOM · CLASS	PURITY	ASN (SCAN-TIME) / LIVE INFRA	DOMAINS	WHAT THE FINGERPRINT SURFACES
<code>4f1ef14beab42d48</code> CREDENTIAL PHISH	100%	AS60404 · The Infrastructure Group B.V. Live exposure

THE FUNNEL

STAGE	N	NOTE
Bulletproof / known-malicious ASNs probed	25	curated (AEZA, Stark, Media Land, Prospero, IP Volume, Chang Way, AlexHost, Pfcloud, Private Layer, LITESERVER, NovoServe ...)
Candidate fingerprint clusters examined	34	top fingerprint.dom buckets inside the ASN set
High-purity malicious kit fingerprints confirmed	6	purity $\geq$ 74%; four at 97–100%
Server-default fingerprints rejected	~28	403/404/nginx/FASTPANEL/empty — purity 0.2–4%, corpus-wide, non-discriminating
Confirmed malicious domains across clusters	348	sum of the six clusters
Still hosting (2 Oct triage)	216	real origin response
of which credential-phishing (highest harm)	25	the LifeMiles cluster — the only credential harvester

Rejected hypotheses & controls

WHAT FAILED

- **Server-default fingerprints as clusters** — hashes for '403 Forbidden' / '404 Not Found' / 'Welcome to nginx' / 'FASTPANEL' / 'Index of /' / empty DOM returned thousands of domains across 29–30 ASNs at 0.2–4% purity. These fingerprint the *web-server default*, not a kit. **Killed by the purity test.**
- **ASN as a clustering seed** — the server array records every resource's ASN, so a page on a bad ASN that loads Google/Cloudflare/Fastly assets cross-matches those CDNs. ASN was used only to *select*; clustering seeded on fingerprint.dom, and the main-page ASN was re-confirmed per rescan.
- **AEZA/Stark/Media Land = active campaigns** — present in corpus but only as thin default husks in-window; no high-purity kit. Named but not featured.
- **Gambling/piracy as 'findings'** — 1win/1xbet and film-piracy fleets are standing DROP as brand-abuse, but here they are legitimate *infrastructure* findings: they map the operators and blocks (NovoServe 81.91.178.0/24) that also host the redirector layer.

```

```
METHOD: terms(server.asn.number ∈ BP-set) → terms(fingerprint.dom) → purity = bp_docs/global_docs; keep ≥ ~50%, drop server  
-default hashes
```

Recommendations

BY AUDIENCE

Takedown / abuse (act now)

- Report the LifeMiles cluster to Avianca/LifeMiles fraud + the registrars (Spaceship, Tucows) and to AS60404 (The Infrastructure Group) and Namecheap (66.29.148.x) — it is harvesting live member credentials.
- Submit the NovoServe 81.91.178.0/24 and shortener *.shop sets to NovoServe abuse and to the .shop / .lat registries.

Detection engineering

- Deploy the six fingerprint hashes as standing Webamon monitors — they rotate domains and IPs but keep the DOM kit, so the fingerprint survives.
- Adopt the purity metric (bp_docs/global_docs) as the standing rank for any ASN-selected hunt; auto-drop server-default hashes below ~50%.

Threat intel

- Track NovoServe AS204601 as a multi-operation bulletproof host (phish-adjacent redirector + gambling + piracy on shared blocks); watch for the LifeMiles fingerprint reappearing on new ASNs (rotation already observed to Namecheap).

Method — Infrastructure hunt, not brand. Selection on server.asn.number ∈ a curated 25-ASN bulletproof/known-malicious set over scans-2026.09. + scans-2026.10.*; clustering seeded on the selective fingerprint.dom content hash (never on ASN/SSL, which are CDN-bound). Clusters ranked by purity = share of the fingerprint's whole-corpus footprint inside the bad-ASN set; high purity ⇒ the hash surfaces only malicious infrastructure. Server-default fingerprints (403/404/nginx/FASTPANEL/empty) were identified by low purity (0.2–4%) and excluded. Ownership by RDAP on the headline cluster: 31/35 ATTACKER_PROFILE (Spaceship/Tucows), created 1–26 Sep 2026; 0 corporate/brand-protection registrations. Liveness three-state, verified 2 Oct 2026; every STILL HOSTING claim for the featured domains is backed by a fresh Webamon rescan whose report link is cited — rescans re-confirmed the main-page ASN. Attribution rests on shared DOM fingerprints, shared /24 blocks and batch registration — not on co-location alone. No systems were accessed and no non-public information was used. Collisions/standing-drop content (gambling, piracy) retained here deliberately as infrastructure, not brand-abuse, findings.*
