

Impersonation of African financial, revenue, identity and utility infrastructure

Scope: 66 entities across 20+ African nations — banking, mobile money, fintech, telecom, government digital services, revenue authorities, electoral bodies, power, ports and rail · **Window:** 1 January – 10 August 2026 · **Method:** rendered page content; no domain-string or permutation matching · **Verification:** liveness probe and DOM inspection on all candidates, screenshot review on the shortlist

VERIFIED NOT THREATS

Bottom line

Across 66 African entities we confirm **22 impersonating domains** year to date, **14 of them still hosting** at verification. Eight were confirmed by screenshot review; the rest by an unambiguous credential form on a domain unrelated to the institution it presents.

Two findings matter more than the count. A credential page for **TANESCO**, Tanzania's national electricity utility, was live on an unrelated domain — critical-infrastructure access, not consumer fraud. And a page rendering a complete **Federal Republic of Nigeria Digital NIN Slip** was harvesting the national identity number together with surname, date of birth, gender and birth LGA.

The headline we expected was not there, and that is itself the most useful result. The sweep surfaced 16 South African SASSA/SRD grant "status check" sites, and an automated DOM test flagged 10 as soliciting a South African ID number. Screenshot review overturned every one. They are independent information sites and ad-supported content farms that link to the official `srd.sassa.gov.za` and actively warn users not to share their ID number or OTP. Section 5 explains why the automated test was wrong — it is a mistake worth naming, because it would have produced a confident and completely false headline.

The image is a composite of two parts. The left part is a dark blue vertical rectangle. At the top left, there is a logo consisting of a stylized orange 'S' inside a circle, followed by the word 'TANESCO' in white, and 'Tanzanian Contract Management' in a smaller white font below it. Further down, the text 'Powering Tanzania, managed end-to-end.' is written in a large, bold, white font. Below this, in a smaller white font, is the sentence 'Track contracts, tenders, payments, extensions and contractor performance across every hydro and thermal plant in one place.' At the bottom of this section is a bulleted list of three items: '• Live expiry & payment alerts', '• Procurement plans actual', and '• Contractor performance & risk scoring'. The right part of the image is a white rectangular card with a thin orange border, set against a light gray background. At the top of the card, it says 'Welcome back' in bold black text, followed by 'Sign in to access the management console.' in a smaller gray font. Below this are two input fields: the first is labeled 'Email' and the second is labeled 'Password'. Both fields have orange borders and are currently empty. At the bottom of the card is a solid orange button with the text 'Sign in' in white. To the right of the card, there is a small gray box with the text 'Download this app on your phone or tablet' in a light gray font.

NIMC NIN Verification · **STILL HOSTING**

Nigeria NIN — the identity set, not a password. [naictic.space](#) presented “NIMC NIN Verification” with NIN and phone tabs, and rendered a facsimile **Federal Republic of Nigeria Digital NIN Slip** carrying surname, first and middle name, date of birth, gender, phone, birth state and birth LGA. The NIN is mandatory for SIM registration, bank accounts and government services in Nigeria, so this is the same pattern seen in India: the identity number is worth more than any credential. The domain reverted to a default web-server page by 18 July, which is why liveness alone would have scored it as harmless.

8 banking and 5 fintech findings — the largest category, and the most conventional. Absa alone accounts for three domains.

3 — Revenue authorities and public services

4 revenue findings across Kenya and Nigeria, plus 2 in education and student finance.

Nigeria’s Federal Inland Revenue Service. `ag-engsg-ts.com` — a domain with no relationship to FIRS — renders the Nigerian coat of arms above an email-or-phone and password form. State insignia is doing the persuasion work; the domain contributes nothing, which is exactly why domain-based monitoring does not see it.

The Kenya Revenue Authority set is different in character. `kra-ke.online` advertises “*File KRA NIL Return Online – No PIN Needed*”, `kraquery.com` offers “KRA PIN Insight”, and `kra-hub.com` posts credentials to its own endpoint. Offering to file a return without the taxpayer’s PIN is the tell — the PIN is the credential.

kaliotp.dev

OTP interception service · **STILL HOSTING**

OTP interception sold as a service, priced in M-Pesa. kaliotp.dev advertises “Real US numbers. Instant OTPs.” — pick a service (WhatsApp, Telegram, Discord), pay with M-Pesa, and receive a non-VoIP US number that takes the verification code. It impersonates nobody, so no brand-monitoring programme would ever surface it, yet it directly defeats the SMS second factor that African banking and mobile money depend on. We include it because a report that only counts impersonation misses the tooling that makes impersonation pay.

5 — The finding we did not report, and why

The sweep surfaced **16 South African SASSA / SRD grant status-check sites**. The SRD is a mass-participation cash transfer reaching roughly eight million people a month, so an identity-harvesting operation around it would be a serious finding. An automated DOM test flagged **10 of the 16** as soliciting a South African ID number, phone number and OTP.

Screenshot review overturned all of them. `srdstatus.com` states *"We are an independent information website. We don't process applications or payments... We're not affiliated with SASSA. Never pay fees or share OTP"* and carries badges reading "Official links only" and "No data collected". `sassastatuscheckerz.online` goes further: *"this site does not collect your ID number, phone number or banking details"*. Both send the user to the official `srd.sassa.gov.za`.

The automated test was detecting mentions, not collection. Those pages talk about ID numbers and OTPs precisely because they are explaining how the official process works and warning against phishing. A regular expression cannot tell the difference between a page that warns about ID-number theft and one that performs it. The two that also matched a form or password signal were no better: `precisegrantupdate.com` is a bare WordPress content farm whose "password" was the WordPress login, still carrying its default *"Hello world!"* post.

Recorded because the failure mode generalises. Any heuristic built on keyword presence will systematically mistake safety messaging for the threat it describes — and will do so most often on exactly the consumer-protection content you would least want to take down. The discriminator is a form that posts the field to the site's own endpoint, not the presence of the words. These 16 domains are listed as verified-not-threats in the IOC file so that no downstream consumer re-flags them.

6 — Detection quality

7 of 22 findings carry no brand token in the domain (32%). The clearest cases are the ones that matter most: `generationconstract.com` (TANESCO), `ag-ensg-ts.com` (FIRS), `naictic.space` (NIN) and `ccredu.org` (Equity Bank). No permutation engine seeded on those institution names generates any of them.

Where domain logic does work. `capitecbank.cfd`, `chipper-cash1.site`, `jumiapro.site` and `kra-ke.online` are all derivable from the brand by a competent permutation list, and should be caught that way. `flutervvave.mom` sits between the two — a homoglyph substitution that a permutation list catches only if it models `vv` for `w`. The methods are complementary; this report is not an argument that one replaces the other.

Infrastructure clustering was attempted and produced nothing. The largest shared-IP groups resolve to Google (14 2.250.117.95, 142.251.29.94/95) and Cloudflare (104.17.24.14). Domains sharing those addresses share a CDN, not an operator. We report no campaign attribution from them, and the same-day registration pairs (four pairs of two) are too small to distinguish from coincidence.

7 — What we excluded, and why

The sweeps returned **12,298 candidate domains** and **22** survived. Africa has the worst collision profile of any region assessed so far, because so many institutional names are ordinary English words or acronyms that mean something else elsewhere.

Dropped	Reason
8,616	No specific African service, brand or place in the rendered page
1,930	African context present but no credential, identity or account-action solicitation
1,006	Gambling and betting sites using a payment or telecom brand - real, but a different problem
194	No rendered title
100	US business content matched on an African acronym (IEC/ECG/NIN/DOT)
72	Healthcare provider content matched on 'huduma'/'ECG'
65	Hosting and domain-registrar pages matched on 'registration'
51	European retail/hospitality matched on an acronym (NIN)
47	East-Asian content matched on an African acronym (SHA/NIN)
40	B2B vendor marketing matched on a brand acronym
23	'MTN' collides with Mountain Dew and mountain/hiking content
21	Named betting operator - gambling, not service impersonation
18	Unrelated trade/services business matched on an acronym
15	Investment and get-rich-quick scams - a distinct category
14	Adult sites
12	SaaS/accounting tooling matched on 'statement'/'filing'
9	'SARS' collides with SARS-CoV-2 - pandemic and virology content
7	News coverage referencing the brand

The collision that would have ruined the report. **SARS** is the South African Revenue Service — and SARS-CoV-2. The pandemic and virology corpus dwarfs the tax authority by orders of magnitude. Without an explicit filter, a South African revenue hunt returns epidemiology. Comparable traps: **MTN** matches Mountain Dew and hiking content; **NIN** matches Nine Inch Nails merchandise and a French leather-goods brand; **IEC** matches the International Electrotechnical Commission and a Colorado apprenticeship scheme; **ECG** matches electrocardiogram; **SHA** matches Sha Tin, Hong Kong.

1,006 gambling and betting sites were excluded. African betting operators — 22bet, Melbet, SportPesa, Betika, LuckyPari, Odibets and others — advertise M-Pesa and mobile-money deposits heavily, so they match a payment-brand sweep in volume. They are a real consumer-harm problem and a legitimate subject for a separate assessment; folding them in here would have multiplied the payments category several times over and buried the credential-harvesting findings.

8 — Recommendations

- **Treat utility and state operational systems as monitored assets in their own right.** The TANESCO console is the highest-consequence finding here and it impersonates no consumer brand. Brand-scoped monitoring would never have produced it.
- **Monitor the national identity number, not just bank brands.** Nigeria's NIN follows the Aadhaar pattern: one number gates SIM registration, banking and government services, which makes it the asset worth stealing.
- **Alert on state insignia in rendered content.** A coat of arms on a non-government domain is a high-precision signal that needs no brand string, and it is what carried the FIRS page.

- **Watch for offers to transact without the credential** — “file your KRA return, no PIN needed” is an admission, not a feature.
- **Track OTP-bypass services as infrastructure.** They impersonate nobody and defeat the second factor that African mobile money relies on. Pricing in M-Pesa tells you the intended market.
- **Require a collection signal, not a keyword, before actioning consumer-information sites.** Section 5 is the worked example: the automated test would have taken down sixteen sites whose actual function is warning citizens about the fraud.
- **Handle betting as a separate programme.** 1,006 excluded domains are real and use the payment rails, but mixing them into fraud metrics distorts both.

waecpins.com	Ghanaian exam-voucher reseller - a lawful trade; retained as context only

Webamon regional threat assessment. Findings derive from rendered page content observed between 1 January and 10 August 2026; liveness was established by direct DNS and HTTP probe on 10 August 2026, and DOM inspection was performed on every candidate. Eight findings were additionally confirmed by screenshot review. No finding derives from domain-string, permutation or certificate matching. 12,298 candidates were screened and the exclusion reasons are itemised in section 7. Sixteen SASSA/SRD status-check sites initially flagged by automated DOM inspection were cleared on visual review and are listed in Annex B; section 5 records why the automated test was wrong. No campaign attribution is drawn from shared CDN addresses.
