NO BRAND TOKEN

267

CONTENT-CONFIRMED

Bottom line for the assessed reader

This assessment confirms **1,802 conflict-adjacent domains**, of which **1,770 (98%) contain no recognisable brand string**. They were found by matching rendered page content, because in this threat space there is frequently nothing in the domain to match.

How liveness was established, and what the result says

Rather than rely on a third-party re-scan queue, every one of the 1,802 domains was probed directly on 3 August 2026 - DNS resolution first, then an HTTP retrieval of the rendered page title for comparison against the title first observed. The whole set completed in a little over four minutes.

Result	Domains	What it establishes
Still resolving in DNS	1,789	The registration is live and pointed at hosting
Content confirmed unchanged	236	Retrieved page title matches the title first observed
Content changed	28	Resolves and serves, but no longer the same page
Retrieval blocked	1,229	Resolves, but automated retrieval refused - status not assertable
No DNS record	13	Unambiguously gone

Only 13 of 1,802 domains have actually gone away. 1,789 still resolve. We can only assert content for 267 of them, because 1,229 refused automated retrieval - 403, 429 or a refused TLS handshake - with 444 sitting behind a Cloudflare edge address. That blocking is not an obstacle to the assessment so much as part of it: this infrastructure is deliberately configured to resist exactly the kind of automated inspection a defender would run. We report the three states separately rather than collapsing a blocked probe into "offline", which would have overstated remediation by an order of magnitude.

The single most important judgement in this report is about what the data does *not* show. Our collection is a web-scan corpus. It sees infrastructure that is *published* - mass-registered phishing, impersonation and content farms. It does not see low-volume spear-phishing delivered by email to named individuals, which is the documented tradecraft of the China-aligned espionage actors currently targeting Taiwanese semiconductor firms. We searched specifically for that tradecraft and did not find it. That is a statement about our sensor, not about the absence of the threat, and Section 6 sets out the boundary precisely.

What the data *does* support, with high confidence:

- **Taiwan's civil infrastructure is under sustained, commercially motivated impersonation** - telecom top-up, banking, toll and airline booking - running continuously across the whole observation window rather than in response to political events.

- **The semiconductor sector appears in our data as a *narrative* target, not a *credential* target.** The single clearest semiconductor cluster is a fabricated financial-news article about TSMC pricing, not a fake TSMC login.
- **Registration behaviour is industrial in scale and tracks commercial calendars, not military ones.** The largest same-day batch we observed is 237 domains.
- **Infrastructure concentration is the strongest available pivot,** and in two cases it runs through networks operated by major providers rather than bulletproof hosting.

Scope and collection

Layer	Covered	Findings
Taiwan civil infrastructure	Telecom, banking, postal, toll, rail, aviation, health, government services	150
Semiconductor chain	Foundry, EDA and IP, equipment, OSAT, materials, fabless design	27
Export control	Accelerator diversion, entity-list and licensing lures	0
Information operations	Fabricated news carrying semiconductor and regional-security narratives	21
PRC-facing brand abuse	State portals, regulators, telecom and payment - included as a comparative baseline	1620

A note on the PRC-facing findings. Slightly over four-fifths of the raw count targets mainland Chinese citizens rather than Taiwanese ones. We have kept it separate throughout and never blend it into the Taiwan totals. It is included because it provides the comparative baseline that makes the Taiwan numbers interpretable: it shows what industrial-scale, purely criminal domain abuse looks like in the same region and the same window, which is the correct control against which to read a smaller, more targeted Taiwanese dataset.

1 — Taiwan’s civil infrastructure

Taiwan’s dependency surface is unusually concentrated. A small number of operators carry almost the entire population: one incumbent telecom, a handful of banks, two flag carriers, one toll operator. That concentration is efficient for the state and equally efficient for anyone impersonating it.

Chunghwa Telecom prepaid top-up — a seven-month sustained campaign

22 domains serve a prepaid top-up page for Chunghwa Telecom, Taiwan’s incumbent carrier. What makes this the most operationally significant Taiwanese finding is not the volume - it is the **persistence and the deliberate orthographic drift**.

The brand is chunghwa. Across the window the registrations move through changhwa, changwa, chawha, chwa, chunghma, chtwa and chttw - a different spelling almost every time, month after month from January to May. This is an operator iterating around a blacklist, and it is precisely the behaviour that defeats exact-match domain rules while leaving the rendered page unchanged.

changhwa-topup.cam OFFLINE

預付卡儲值 - 中華電信

2026-01-17 · 198d since registration · 172.67.199.64 · token

A prepaid top-up page for Chunghwa Telecom, Taiwan’s incumbent carrier. This is the recognisable end of the campaign - a permutation list seeded with chunghwa would plausibly catch it.

chwatopup.shop OFFLINE

預付卡儲值 - 中華電信

2026-04-23 · 102d since registration · - · token

The same page, seven weeks later, with the brand compressed to chwa. Across the window the spelling drifts through changhwa, changwa, chawha, chunghma and chtwa - one operator iterating around a blacklist while the rendered page never changes.

Three carriers in one page. Several of these (topup-mobilephones.com, mobiletopups-taiwan.com, prepaid-taiwain.com) do not impersonate Chunghwa alone - they render a combined top-up portal covering **Chunghwa Telecom, FarEasTone and Taiwan Mobile together**. A single page therefore addresses effectively the entire Taiwanese mobile subscriber base, and the domain names carry no carrier brand at all.

Flag carriers — 110 domains registered in a single month

110 domains render the identity of Taiwan's two flag carriers, 長榮航空 (EVA Air) and 中華航空 (China Airlines). **All 110 were registered in January 2026, and 58 of them on 18 January alone.** Every one is a random consonant string - asrdzr.com, bshgvvy.com, dcbswop.com - carrying no brand token whatsoever.

asrdzr.com **RESOLVING**

長榮航空

2026-01-18 · 197d since registration · 172.67.184.91 · **no token**

Serves the identity of EVA Air. The domain is a random consonant string with no brand content of any kind, and it resolves into Meta address space rather than to bulletproof hosting.

cfdxs.com **RESOLVING**

中華航空

2026-01-12 · 203d since registration · 142.250.129.97 · **no token**

China Airlines, from the same January batch. 110 of these were registered in a single month and 58 on 18 January alone - roughly four weeks before Lunar New Year, the peak booking window for Taiwan's largest travel event.

The hosting is the finding. 56 of these domains resolve into **Meta / Facebook address space** (57.144.238.128, 157.240.214.11, 57.144.240.128), with most of the remainder behind Cloudflare and Google. This is not bulletproof hosting in a permissive jurisdiction - it is mainstream platform infrastructure, which both lends the pages reachability and reputation, and means takedown runs through a small number of large providers rather than an offshore registrar.

On timing: 18 January 2026 sits roughly four weeks before Lunar New Year (17 February 2026), which is the peak booking period for the largest travel event in the Taiwanese calendar. We assess this batch as **commercially timed rather than politically timed**. Analysts should resist reading a January spike in Taiwan-facing infrastructure as escalation-related when a sufficient commercial explanation exists.

Banking

12 findings target Taiwanese banks. The E.SUN set is the cleanest illustration in this report of why domain-derived detection fails: six domains - vexaloria.vip, veltriona.vip, sylverion.vip, nexoritha.vip, lumenvora.vip, kaeltrona.vip - all registered on **11 May 2026**, all serving an E.SUN Bank currency-conversion page, and all built from invented, pronounceable fantasy words bearing no relationship to the bank whatever. There is no string here for a permutation engine to derive.

vexaloria.vip **LIVE**

匯率及幣值換算 - 階梯加碼優惠 | 玉山銀行

2026-05-11 · 84d since registration · 43.169.13.15 · **no token**

An E.SUN Bank currency-conversion page. The domain is an invented, pronounceable fantasy word - one of six registered on 11 May 2026 in the same style. There is no string here that any permutation engine could derive from the bank's name.

payment-link-taiwan.com **OFFLINE**

信用卡付款頁面 - CTBC Bank

2026-03-23 · 133d since registration · 104.18.11.207 · **no token**

A CTBC Bank credit-card payment page. Note the sibling domain in this set spells it invoice - the operators are more careless with English than with the rendered Mandarin, which is a usable detection signal.

Impersonating the anti-fraud service itself

Two domains (165tw.xyz, 165tw.forum) reproduce 165 全民防騙網, the National Police Agency's public anti-fraud reporting service. Impersonating the reporting channel is a second-order attack: it targets people who have *already* recognised they may have been defrauded, at the moment they are most willing to hand over account details to someone presenting as the authority.

2 — The semiconductor supply chain

We scoped the chain end to end - EDA and IP, foundry, equipment, materials, OSAT and fabless design - on the basis that an adversary interested in Taiwanese semiconductor capacity has no reason to stop at the fabs. The result is worth stating plainly because it is not what a reader might expect.

In our telemetry the semiconductor sector is targeted as a narrative, not as a credential. We found no mass credential-harvesting campaign against TSMC, UMC, ASE, ASML or any equipment vendor. What we found instead is fabricated *financial news* about them. That distinction matters: it points at market manipulation and audience-building rather than at network access, and it is consistent with our sensor seeing published infrastructure rather than targeted email.

The TSMC pricing article — 14 domains, one operator

Fourteen domains serve a byte-identical fabricated article titled "台積電財務長黃仁昭BBC專訪：經營成本上升·晶片不排除加價"— "TSMC CFO Wendell Huang, BBC interview: rising operating costs, chip price increases not ruled out". The article attributes a market-moving statement about chip pricing to a named TSMC executive and attributes the interview to the BBC. Neither the attribution nor the interview is genuine.

33vo.cc **RESOLVING**

台積電財務長黃仁昭BBC專訪：經營成本上升·晶片不排除加價
2026-07-03 · 31d since registration · 156.234.124.84 · **no token**

A fabricated article attributing a market-moving statement on chip pricing to TSMC's named CFO, and attributing the interview to the BBC. Neither is genuine. Fourteen domains carry this byte-identical page.

56kkk.cc **CHANGED**

台積電財務長黃仁昭BBC專訪：經營成本上升·晶片不排除加價
2026-07-02 · 32d since registration · 156.234.124.86 · **no token**

The same fabricated TSMC article on a sibling domain. All fourteen were registered on 2-3 July 2026 and resolve into one narrow address range on a single autonomous system, which is what makes the hosting rather than the brand the useful pivot.

All fourteen were registered on **2–3 July 2026** and all resolve into a single narrow address range on one autonomous system, **Yancy Limited** (156.234.124.83–86, 23.226.50.115, 156.234.58.182). The domains themselves are throwaway two-to-five character strings on .cc.

What else that infrastructure carries

Pivoting on the hosting rather than the brand is what makes this finding useful. The same autonomous system carries **605 domains** in our dataset, and the TSMC article sits inside a much larger fabricated-news and gambling-portal operation. Sibling articles on the same infrastructure include:

- "曼德海峽：胡塞武裝的威脅會否觸發紅海航運危機？" — Bab el-Mandeb and Houthi threats to Red Sea shipping
- "被列軍工名單 阿里巴巴狀告美國國防部" — Alibaba suing the US Department of Defense over military-list designation
- "什麼是「依托咪酯」？新型毒品危機蔓延東亞各國" — a narcotics crisis spreading across East Asia

- Consumer filler on the same template — a fabricated BBC interview about a film production, and an article about GTA 6 distribution

Assessment, stated with its confidence. The mixture is the evidence. A dedicated influence operation does not normally pad its infrastructure with gambling download portals and video-game filler. We assess with **moderate confidence** that this is a **commercially motivated fabricated-news and traffic operation** that produces geopolitically-themed content because that content performs, rather than a state-directed influence campaign. We say so explicitly because the alternative reading - PRC information operations targeting confidence in TSMC - is available, consequential, and not supported by anything we can currently see. Confirming or refuting it requires visibility we do not have: the amplification layer.

Accelerator supply and export-control lures

4 findings sit on the export-control seam - pages offering restricted-class accelerators for bulk supply, and investment lures using NVIDIA branding with Web3 and compute-yield framing. The volume is low and we are not going to inflate it. It is reported because the category is strategically significant out of proportion to its size: this is the demand signal for diversion, and it is worth monitoring even at single-digit volumes.

Domain	Campaign	Rendered title	Server IP	Token	Registered	Status

3 — ATT&CK mapping of observed activity

The techniques below are mapped **only to behaviour we directly observed in this dataset**. We have not mapped techniques that would plausibly follow but that our collection cannot evidence - no execution, persistence, lateral movement or exfiltration technique is claimed, because a web-scan corpus cannot see them.

Technique	Name	Evidence in this dataset
T1583.001	Acquire Infrastructure: Domains	1,802 registrations, including same-day batches of 237, 198 and 110
T1583.003	Acquire Infrastructure: VPS	605 domains concentrated on one AS (Yancy Limited) in a narrow /24 range
T1583.006	Acquire Infrastructure: Web Services	56 aviation-lure domains resolving into Meta address space; heavy Cloudflare and Google fronting throughout
T1584.005	Compromise Infrastructure: Botnet	380 domains serving a China Mobile portal from inside China Mobile's own AS on two addresses
T1656	Impersonation	Rendered reproduction of carriers, banks, flag carriers, state portals and a national anti-fraud service
T1036.005	Masquerading: Match Legitimate Name or Location	Orthographic drift across chungwa → changhwa → chawha → chtwa
T1608.005	Stage Capabilities: Link Target	Credential and payment pages staged and reachable ahead of distribution
T1566.002	Phishing: Spearphishing Link	Inferred delivery mechanism for staged credential pages; the lure page is observed, the email is not
T1204.001	User Execution: Malicious Link	Transactional pages requiring the victim to complete a top-up or payment
T1585.001	Establish Accounts: Social Media	Assessed, not confirmed - Meta-hosted landing pages imply an account layer we cannot observe
T1591.002	Gather Victim Org Information: Business Relationships	Multi-carrier top-up pages covering all three Taiwanese operators in one template

On T1566 and T1204. Both are marked as inferred. We observe staged pages whose only purpose is to receive a visitor who arrived from somewhere else. The delivery vector is a reasonable inference, not an observation, and it is flagged as such so that it is not later cited back as confirmed collection.

4 — Tracked actors: published reporting, not our attribution

Read this section as context, not as findings. Nothing in our dataset is attributed to any group named below. These are the publicly documented actors operating against the sectors we scoped, summarised so that the reader can see where our telemetry sits relative to the known threat picture - and, more importantly, where it does not.

Actor	Reported targeting	Reported tradecraft	Would we see it?
UNK_FistBump	Taiwanese semiconductor manufacturing, packaging and test; HR and recruitment teams	Employment-themed spearphishing from compromised Taiwanese university accounts; DLL side-loading via signed binaries (javaw.exe, CiscoCollabHost.exe); Cobalt Strike Beacon then the custom <i>Voldemort</i> backdoor	No — email-delivered to named recipients
UNK_DropPitch	Investment analysts covering the Taiwanese semiconductor market	PDF link → ZIP → malicious DLL; <i>HealthKick</i> backdoor and raw TCP reverse shells	No — attachment chain, not published web
UNK_SparkyCarp	A Taiwanese semiconductor company	Custom adversary-in-the-middle credential phishing kit	Partially — an AiTM kit is web-hosted and is the one tradecraft here our sensor could in principle observe
TA415	Taiwanese semiconductor manufacturing and supply chain	Escalating campaigns reported through 2025–26	No — targeted delivery
UAT-5918 (overlaps Volt/Flax Typhoon)	Taiwanese telecommunications, healthcare, IT and other critical infrastructure	Exploitation of unpatched internet-facing web and application servers; open-source tooling; credential theft; administrative account creation	No — exploitation of victim-owned infrastructure leaves no attacker-registered domain
Flax Typhoon	Taiwanese government and technology sectors	Compromise of internet-facing devices; IoT botnet construction for onward operations	No — compromised legitimate devices, not registered domains

Between March and June 2025, Proofpoint attributed three distinct China-aligned campaigns against Taiwanese semiconductor entities to UNK_FistBump, UNK_DropPitch and UNK_SparkyCarp, assessing the motive in all three cases as most likely espionage. Cisco Talos separately tracks UAT-5918 against Taiwanese critical infrastructure, with reported overlap into Volt Typhoon and Flax Typhoon activity.

5 — What we searched for and did not find

A report that only lists what it found is not usable for planning. We ran targeted searches for the espionage tradecraft described in Section 4 and are recording the negative results, including the control tests that make them meaningful.

Searched for	Corpus hits	Assessment
CiscoCollabHost (side-loading host binary)	1	Single unrelated site. No campaign.
HealthKick (UNK_DropPitch backdoor)	1	Single unrelated site. No campaign.
beacon.x64.dll	1	Single unrelated site. No campaign.
javaw.exe (side-loading host binary)	8	Java utility sites and a VPN download page. Benign.
cobaltstrike	39	Security-research blogs and pentest reference sites — not operational C2.
Voldemort (backdoor name)	1,136	A semantic collision with the Harry Potter character, not the backdoor. Discarded.
Taiwanese university webmail impersonation	0	The account-compromise vector reported for UNK_FistBump is not visible to us.

Control test. Before drawing any conclusion from those counts we tested whether the corpus returns a false-positive floor for filename strings. Nonsense controls — `zzqxxx.exe`, `blorpwidget.exe`, `qwzzpt1.dll`, `zzzcobaltzzz` — each returned **zero**. The matching is therefore exact rather than tokenised, which means the low counts above are real low counts and not an artefact of the query. It also means the 1,136 "Voldemort" hits are a genuine semantic collision, and an analyst who had not run the control could easily have reported them as a backdoor campaign.

The resulting collection boundary

Layer	Visible to this collection?
Mass-registered impersonation and credential pages	Yes — this is the bulk of the report
Fabricated-news and content-farm infrastructure	Yes
Hosting concentration and registration batching	Yes — and it is the strongest pivot available
Web-hosted adversary-in-the-middle kits	Partially — observable in principle; none confirmed against Taiwanese semiconductor targets here
Spearphishing email and attachment chains	No
Exploitation of victim-owned edge infrastructure	No
Post-compromise activity of any kind	No

The practical consequence for a government consumer is that this report should be read as **one layer of a multi-source picture**. Its strength is breadth and timing across published infrastructure; it is not, and cannot be, evidence on the espionage question. Where the two layers meet is the AiTM row - the one place our sensor and the reported tradecraft overlap, and therefore the highest-value place to direct additional collection.

6 — Operating tempo and calendar correlation

Registered	Domains	Volume
2026-01	119	
2026-02	4	
2026-03	266	
2026-04	73	
2026-05	53	
2026-06	352	
2026-07	768	
2026-08	155	

Date	Observed	Calendar context	Assessment
18 Jan 2026	58 flag-carrier domains in one day; 110 across the month	~4 weeks before Lunar New Year (17 Feb 2026)	Commercial — peak travel booking
11 May 2026	6 E.SUN Bank domains, invented-word names	No significant political or commercial date identified	Opportunistic batch
2–3 Jul 2026	14 fabricated TSMC pricing articles	Ahead of Q2 earnings season for Taiwanese semiconductor firms	Plausibly market-timed; not confirmed
29 Jul 2026	237 PRC State Council portal domains in one day	No Taiwan-related date identified	PRC-domestic criminal tempo
28 Nov 2026	— outside window —	Taiwanese local elections	Forward-looking watch point

The honest finding on calendar correlation is a negative one. We looked for registration activity timed to PLA exercise announcements, strait incidents or political anniversaries and **did not find it**. Every spike we can explain is explained by a commercial calendar. Analysts should treat volume spikes in Taiwan-facing domain registration as a poor indicator of escalation on current evidence, and should specifically guard against the reverse error - reading a Lunar New Year travel-fraud surge as a strategic warning signal. The Taiwanese local elections on 28 November 2026 fall outside this window and are the obvious next collection point.

7 — PRC-facing baseline

1,620 findings target mainland Chinese users. They are reported separately and never blended into the Taiwan figures. Their analytic value is as a control: they show the shape of purely criminal, industrial-scale domain abuse in the same region and the same window.

Campaign	Findings	Still hosting	No token
PRC State Council portal	481	44	481
China Mobile	480	26	479
PRC banking regulator	323	0	323
PRC payment	287	121	286
PRC banking	32	19	21
PRC telecom	15	14	12
PRC state services	2	2	2

Two structural observations worth carrying across. First, the PRC State Council cluster uses a rigid algorithmic naming scheme — `NNNrr.top` and `NNNff.top` — and 237 of them were registered on a single day, with the batch still being extended on 1–2 August, the days immediately before this assessment closed. Second, 380 domains serving a China Mobile portal resolve to just two addresses **inside China Mobile own autonomous system**. Infrastructure sitting within the impersonated carrier network is a materially different problem from offshore hosting, and it is the most interesting structural fact in the PRC-facing set.

We also note that the impersonated banking regulator, 中国银行保险监督管理委员会, was superseded as an institution in 2023. The operators are reproducing a body that no longer exists under that name — a useful reminder that these kits are copied forward rather than maintained, and a cheap detection opportunity for anyone monitoring the brand.

8 — Detection quality

98% NO BRAND TOKEN	1668/1790 SEEN WITHIN 24H OF REGISTRATION	1790/1790 SEEN WITHIN 7 DAYS	5 MEDIAN DAYS LIVE REGARDLESS
-----------------------	---	---------------------------------	----------------------------------

Of 1,790 findings with a recoverable registration date, 1,790 were observed within seven days of registration and 1,668 within twenty-four hours. Visibility is not the constraint in this threat space; the interval between seeing and acting is.

Why the no-token proportion is higher here than in comparable markets

1,770 of 1,802 findings carry no recognisable brand string. Two properties of this particular region drive that, and both are worth understanding because they are structural rather than incidental:

- CJK brand names do not survive romanisation.** 中華電信 has no canonical ASCII form, so an operator has to invent one — and can then vary it freely, because there is no correct spelling to deviate from. A permutation engine needs a seed string; here there is no agreed seed to give it.
- Several campaigns dispense with the brand entirely.** The flag-carrier set uses random consonant strings, the E.SUN set uses invented fantasy words, and the PRC State Council set uses sequential numerics. None of these are derived from the brand, so none can be generated from it.

Where domain-derived logic does still work, and it should be credited. The Chunghwa Telecom set is the counter-example: changhwa-topup.cam and chungwatopup.cam are recognisable variants that a competent permutation list would catch. The argument in this report is not that such logic is worthless. It is that across this dataset it addresses roughly 2% of the problem, and that the remainder includes every campaign whose operator chose to leave the brand name out on purpose.

9 — What we excluded, and why

The sweep returned 3,617 candidates and 1,802 survived. For an assessment of this kind, the discipline applied to the excluded 1,815 is what the surviving number is worth.

CJK substring collision is the dominant failure mode in this region, and it is severe enough to discredit an assessment that does not control for it. Taiwanese and Chinese brand names are short and they occur inside ordinary compound words. Every example below was present in our candidate set before it was removed.

Excluded	Why
中油 CPC Corporation	Occurs inside 台中油漆 — "Taichung paint". Matched painting contractors, waterproofing firms, plumbers and lubricant distributors.
台電 Taipower	Matched precision-engineering suppliers naming Taipower as a <i>customer</i> in their own marketing copy.
長榮 / 中華航空 EVA Air / China Airlines	Matched travel agencies, charter operators and airport-transfer services listing the airlines they sell tickets for. The 110 retained findings survived only because they form same-title clusters on shared hosting; the mentions were removed.
Novatek	A Taiwanese display-driver designer — but also a locksmith, a clothing retailer, an industrial supplier and a Russian gas producer.
Micron	Micron Agritech, an Irish veterinary-diagnostics firm, plus Micron Optics and Sub-Micron Kinetics. 70 candidates removed.
AMD Ryzen	Appears in VPS hosting plan specifications. 72 removed.
"chip"	Wood-chip delivery and food businesses.
兆豐	Mega Bank, but also a Taichung pawnshop.
Genuine operator infrastructure	hinet.net, taiwanmobile.com, fetnet.net and aptg.com.tw all resolve to 163.70.151.21, which is Chunghwa Telecom own address space. These are the operators themselves, not impersonations of them.
Civil-society sites	Taiwanese disaster-preparedness and military-accountability projects were removed rather than risk naming legitimate civic organisations as threats.

The evidence standard applied. After the first pass we judged that a brand mention alone was not evidence. Every Taiwanese and semiconductor finding retained here meets at least one of three tests: the page is **transactional** (a login, payment, top-up or verification flow); the domain is **clustered** (three or more domains serving a byte-similar page from shared hosting); or it sits on **infrastructure already characterised** as a content farm. Candidates meeting none of the three were dropped, 137 of them.

10 — Recommendations

For Taiwanese operators and regulators

- **Monitor rendered content, not domain strings.** On this dataset a romanisation-based watchlist would miss the majority of findings, and would miss every campaign that deliberately omitted the brand.
- **Publish and enforce a canonical romanisation.** The orthographic drift across the Chunghwa set is possible because no authoritative ASCII spelling exists to deviate from. Registering the obvious variants defensively is cheap relative to the campaign it frustrates.
- **Treat the multi-carrier top-up template as a sector problem.** A page addressing all three operators at once cannot be remediated by any one of them alone.
- **Protect the anti-fraud brand specifically.** Impersonation of the 165 reporting service attacks victims at their most vulnerable moment and directly erodes the reporting channel the state depends on.

For the semiconductor sector

- **Add fabricated financial news to the monitored surface.** The observable semiconductor threat in this dataset is narrative, not credential. Investor-relations and communications functions should be consumers of this feed, not only security teams.
- **Pivot on hosting, not brand.** The TSMC cluster was fourteen domains; the infrastructure behind it carried 605. Brand-scoped monitoring would have found the fourteen and stopped.
- **Direct additional collection at AiTM kits.** Per Section 5 this is the single point where our sensor and the reported espionage tradecraft overlap, and therefore the highest-value gap to close.

For government consumers

- **Do not treat domain-registration volume as a strategic indicator on current evidence.** Every spike we can explain is commercially explained. Using this signal as escalation warning would have produced a false alarm in January 2026.
- **Read this alongside email and endpoint telemetry, not instead of it.** The espionage layer is real and documented; it is simply not visible to this collection.
- **Set 28 November 2026 as a collection milestone.** The Taiwanese local elections fall outside this window and are the obvious next point at which politically-timed activity, if it exists, would become observable.

Annex A — Taiwan and semiconductor findings

All findings outside the PRC-facing baseline, ordered by liveness then by time online. Status was verified by re-scanning on 3 August 2026.

Webamon strategic threat assessment. Findings derive from rendered page content observed in the Webamon scan corpus between 1 January and 3 August 2026; liveness was re-verified on 3 August 2026. Screenshots are reproduced from the scan that first captured each page, and the status badge beside each reflects the position at re-verification. No domain-token, permutation or string-similarity logic was used to generate any finding. Actor names in Section 4 are drawn from published third-party reporting and are provided as context only: no finding in this assessment is attributed to any named group. Negative results and control tests are reported in Section 5 so that the boundary of the collection is explicit.
